Art Unit

3623

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 16 August 2006.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-30 and 43-54 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-30 and 43-54 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## **DETAILED ACTION**

### ***Response to Amendment***

1. This Final office action is in response to Applicant's amendment filed August 16, 2006. Claims 1, 10-13 and 23 have been amended. Claims 1-30 and 43-54 are pending.
2. Applicant's arguments filed August 16, 2006 and March 20, 2006 have been fully considered but they are not persuasive.

### ***Claim Rejections - 35 USC § 112***

3. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

4. Claim 53 is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

Claim 53 has been amended to recite "the route types being independent of geographic location." After reviewing the Applicant's specification, the Examiner has not found any language where the route types are independent of geographic location. Contrarily, Applicant's specification indicates that the routes typically

Art Unit: 3623

represent a geographic area (at least page 2, lines 27-28 and page 6, lines 4-5), that the routes are organized according to geographic data (at least page 8, lines 15-17), and that each timeslot of a route is associated with geographical data (at least page 12, lines 20-21).

***Claim Rejections - 35 USC § 102***

5. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
6. Claims 45-51 and 53 are rejected under 35 U.S.C. 102(b) as being anticipated by Edgar et al (USPN 5,848,395).

As per claim 45, Edgar discloses a computer-implemented method for creating a schedule of timeslot segments for a plurality of routes and timeslots (table 30 for storing a plurality of routes, column 1, lines 17-25 and figure 3), comprising receiving an identification of a selected day for which the schedule is desired, the selected day having a day of week associated therewith (i.e., appointments offered to customers); determining at least one possible route type (i.e., area in which appointments are booked is divided by region, thereby determining route type based upon region, column 1, lines 59-60) for the selected day (i.e., appointment server uses the routes stored in the database, by region, to offer a number of possible appointments to customers, column 2, lines 20-25); determining at least one available route for the selected day based on the at least one possible route type for the selected day (i.e., appointments offered within predetermined time slots) and on a template storing

Art Unit: 3623

predetermined routes for each day of the week (database 10 includes tables 30 one for each day in a predetermined window, column 1, lines 64-66), the predetermined routes stored within the template having route types, the at least one available route not being separated into the available route types (i.e., the region includes a number of routes associated therein, column 1, lines 59-60 and figure 2) and information within the template being independent of particular delivery persons; (i.e., route type determined by region, column 1, lines 59-63); and forming a schedule for the selected day in accordance with the at least one available route, the schedule including timeslots available to be scheduled for the at least one available route (e.g., customer accepts the offered appointment and the scheduler allocates the jobs to the resources).

As per claim 46, Edgar discloses determining at least one predetermined route in the template (table 30) with a route type that matches the route type of the at least of possible route type for the selected day (i.e., server uses the stored routes to offer a number of possible appointments, column 2, lines 20-22).

As per claim 47, Edgar discloses wherein the at least one available route is limited by the predetermined routes in the template that have the at least one possible route type (i.e., limited by number of routes stored).

As per claim 48, Edgar discloses the timeslots include schedulable timeslot segments, and wherein said method further comprises permitting a user to interact with the schedule to modify the number of schedulable timeslot segments for the timeslots (e.g., customer accepts the offered appointment).

As per claim 49, Edgar discloses alerting a user when the schedulable timeslot segments available to be scheduled are within a threshold amount of being completely scheduled (i.e., watchdog 16 monitors status of all jobs and initiates the scheduler if the number of appointments on a particular route exceeds a predetermined threshold, and provides a warning of jeopardy situations, column 3, lines 47-53).

As per claim 50, Edgar discloses each of the timeslots is associated with a geographical area (i.e., region, figure 2).

As per claim 51, Edgar discloses said determining of at least one possible route type (i.e., area in which appointments are booked is divided by region, column 1, lines 59-60) uses a calendar (e.g., database 10 includes a number of tables 30, one for each day in a predetermined window in which appointments may be offered, wherein the window may cover two weeks from the current date, thereby correlating calendar data to the appointment offered, column 1, lines 65-67).

Claim 53 is rejected based upon the rejection of claim 45, since it is the computer readable claim corresponding to the method claim.

### ***Claim Rejections - 35 USC § 103***

7. Claims 1-30, 43, 44, 52, and 54 are rejected under 35 U.S.C. 103(a) as being unpatentable over Edgar et al (USPN 5,848,395), in view of Hanzek (USPN 6,654,726).

As per claim 1, Edgar et al disclose method in a computer system for dynamically creating a schedule of timeslot segments for a plurality of routes and timeslots (appointment booking and scheduling system 10), the method comprising: determining from a calendar, a set of possible route types (i.e., area in which appointments are booked is divided by region, thereby determining route type based upon region, column 1, lines 59-60) for a selected day and a template identifier (routes 31 contained in table 30 for each day in a predetermined window, see figure 3); based upon the determined set of possible route types, retrieving a set of available route types from a template (table 30 for storing a plurality of routes, column 1, lines 17-20 and figure 3) identified by the template identifier (appointment server 12), wherein the available route types are limited to those route types that are within the set of possible route types, and wherein the template includes at least available route types (i.e., appointment server uses the routes stored in the database, by region, to offer a number of possible appointments to customers, column 2, lines 20-25); for each available route type, determining a set of routes for the selected day (i.e., routes 31); and for each set of routes, creating in a data repository a set of schedulable timeslot segments that correspond to the selected day (database 11, see figure 1), wherein the routes are determined based on the available route types, the route types being descriptors or identifiers for grouping the different routes (region "B" i.e., the fourth route from the left, indeed defines an entire route, figure 3), and wherein each of the routes is not separated into different route types (i.e., the region includes a number of routes associated therein, column

Art Unit: 3623

1, lines 59-60 and figure 2), wherein at least one of the available route types is a default route type (i.e., route that visits the region and contains sufficient free time within that region, column 2, lines 20-25), and wherein at least another one of the available route types is a special route type (i.e., new set of routes created via the optimization process, column 2, lines 54-56) and the system thereafter schedules at least one delivery stop using one or more of the set of schedulable timeslot segments (i.e., the scheduler 13 extracts the jobs to be scheduled based upon appointments offered to customers and allocates jobs to resources for specific times, column 2, lines 20-22 and 47-49), the at least one delivery stop being for delivery of a product or service (e.g., service engineer).

Edgar does not explicitly disclose an electronic storefront system. Hanzek discloses a web-based system 310, including a consumer front end 339, used for product ordering, tracking, and delivery of consumer products (figure 3). Both Edgar and Hanzek are concerned with effective delivery of products to consumers. Scheduling service visits, as seen in Edgar, and scheduling delivery of a product, as seen in Hanzek, are both ultimately concerned with the optimization of a route, via an algorithm, in order to facilitate product and service delivery to the consumer in the most expeditious manner. As a result, it would have been obvious to one having ordinary skill in the art at the time the invention was made to include the electronic storefront in Edgar, as seen in Hanzek, as an efficient way to offer the customers in Edgar an interface to schedule appointments of the services offered.

As per claim 2, Edgar et al disclose for each set of routes, determining a set of timeslots, wherein a portion of the set of schedulable timeslot segments are created to correspond to each timeslot (i.e., the number of routes 31 corresponding to each day in table 30, wherein the route including a start and end time, see column 2, lines 8-11).

As per claim 3, Edgar et al disclose wherein the number of created schedulable timeslot segments that correspond to each timeslot are based upon a potential number of timeslot segments associated with each timeslot (i.e., appointments offered within predetermined time slot associated with each route, see column 2, lines 26-27).

As per claim 4, Edgar et al disclose modifying the template such that data that corresponds to at least one of the set of timeslots are changed; and updating the created set of schedulable timeslot segments in the data repository to correspond to the changed data (upon acceptance of offered appointment, the time used and time left fields are updated, see column 2, lines 27-29).

As per claim 5, Edgar et al disclose the template identifier identifies one of the days of a week (see column 1, line 65).

As per claim 6, Edgar et al disclose wherein the method produces a delivery schedule, wherein as the schedulable timeslot segments are scheduled for the at least one delivery stop (i.e., appointments offered within predetermined time slots), the delivery schedule is updated (i.e., new job associated with route and time used and time left fields are updated, column 2, lines 26-29), and wherein the method.

further comprises alerting a user when the schedulable timeslot segments available to be scheduled are within a threshold amount of being completely scheduled (i.e., watchdog 16 monitors status of all jobs and initiates the scheduler if the number of appointments on a particular route exceeds a predetermined threshold, and provides a warning of jeopardy situations, column 3, lines 47-53).

As per claim 7, Edgar et al disclose a schedulable timeslot segment corresponds to an event (e.g., events being appointments offered, column 1, lines 64-66)

As per claim 8, Edgar et al disclose the selected day is a date in the future (predetermined window may cover two weeks from the current date, see column 1, lines 66-67).

As per claim 9, Edgar et al disclose the method is used to create schedulable events for a sequence of days in the future (two weeks from the current date, see column 1, lines 66-67).

As per claim 10, Edgar et al disclose the schedulable timeslot segments are sent to another program to be allocated to actual events (appointment booking scheduler 13, see figure 1), and wherein the actual events are scheduled delivery orders (i.e., delivery of service order from service engineers visiting customer sites, see column 1, lines 8-9).

As per claim 11, Edgar et al disclose the special route type overrides the default route type (i.e., the scheduler uses the optimized sequence of jobs to create a new table 30, representing a new set of routes, thus overriding the stored set of routes, column 2, lines 54-56).

As per claim 12, Edgar et al disclose the special route type indicates that no routes are available for the selected day (i.e., total amount of free time is zero, see column 2, lines 56-58).

As per claim 13, Edgar et al disclose the special route type indicates holiday service is available for the selected day (see column 2, lines 42-44).

As per claim 14, Edgar et al disclose each route is based upon geographical data (see column 1, lines 48-50).

As per claim 15, Edgar et al disclose modifying the template such that data that corresponds to at least one of the set of routes are changed; and updating the created set of schedulable timeslot segments in the data repository to correspond to the changed data (scheduler uses optimization process to create a new table 30 representing a new set of routes, see column 2, lines 54-56).

As per claim 16, Edgar et al disclose using the determined set of routes to automatically generate in the data repository a set of schedulable timeslot segments that correspond to a different day (i.e., done via appointment scheduler, column 2, lines 54-56).

Claims 17-20 are rejected based upon the rejection of claims 1-3, and 6, respectively, since they are the computer readable medium claims, corresponding to the method claims.

As per claims 21 and 22, Edgar et al does not explicitly disclose an order to deliver groceries and the product or service purchased at an online grocery store. Hanzek discloses many retailers having established electronic storefront offering all

kinds of products, including ordering and delivery of groceries (column 2, lines 1-3). Both Edgar and Hanzek are concerned with effective delivery of products to consumers. Scheduling service visits, as seen in Edgar, and scheduling delivery of a product, as seen in Hanzek, are both ultimately concerned with the optimization of a route, via an algorithm, in order to facilitate product and service delivery to the consumer in the most expeditious manner. As a result, it would have been obvious to one having ordinary skill in the art at the time the invention was made to include an electronic storefront for groceries in Edgar, as seen in Hanzek, thereby efficiently scheduling grocery deliver, thus expanding the robustness and flexibility of the Edgar system with different products/services.

As per claim 23, Edgar et al disclose scheduling the delivery of a product a plurality of days into the future (i.e., number of tables 30 for each day in a predetermined window, column 1, lines 64-66), and wherein at least one route type in the set of possible route types indicates that (i) no routes are available for the selected day (i.e., total amount of free time is zero, see column 2, lines 56-58), or (ii) a holiday service is available for the selected day.

Claim 24 is rejected based upon the rejection of claims 1-3, since it is the system claim, corresponding to the method claims.

As per claim 25, Edgar et al disclose the available routes, timeslots, and numbers of potential timeslot segments per timeslot are grouped by day of week (tables 30 corresponding to each day of the week, see column 1, lines 64-65).

As per claim 26, Edgar et al disclose the user interface (gantt manager interface 15, see figure 1) comprises a collection of database forms (tables 30).

As per claim 27, Edgar et al disclose the elements comprise a database system (database 11, see figure 1).

As per claim 28, Edgar et al disclose a scheduled timeslot segment for a timeslot, for a route, for a designated calendar day that was created in the data repository is allocated to an order for a product or service (i.e., service engineers visiting customer sites, see column 1, lines 8-9).

As per claim 29, Edgar et al disclose a scheduled timeslot segment for a timeslot, for a route, for a designated calendar day that was created in the data repository is allocated to a particular customer (i.e., customer appointment, 25-28).

As per claim 30, Edgar et al disclose a timeslot segment is allocated to the particular customer based upon a rating system (i.e., the sequence of jobs is based upon the evaluated cost (rating) of the current sequence, see figure 5).

As per claims 43 and 44, Edgar discloses alerting a user when the schedulable timeslot segments available to be scheduled are within a threshold amount of being completely scheduled (i.e., watchdog 16 monitors status of all jobs and initiates the scheduler if the number of appointments on a particular route exceeds a predetermined threshold, column 3, lines 47-50).

As per claim 52, Edgar discloses a system thereafter schedules at least one delivery stop using one or more of the timeslots scheduled, the at least one delivery stop being for delivery of a product or service (i.e., the scheduler 13 extracts the jobs

to be scheduled based upon appointments offered to customers and allocates jobs to resources for specific times, column 2, lines 20-22 and 47-49). Edgar does not explicitly disclose an electronic storefront system. Hanzek discloses a web-based system 310, including a consumer front end 339, used for product ordering, tracking, and delivery of consumer products (figure 3). Both Edgar and Hanzek are concerned with effective delivery of products to consumers. Scheduling service visits, as seen in Edgar, and scheduling delivery of a product, as seen in Hanzek, are both ultimately concerned with the optimization of a route, via an algorithm, in order to facilitate product and service delivery to the consumer in the most expeditious manner. As a result, it would have been obvious to one having ordinary skill in the art at the time the invention was made to include the electronic storefront in Edgar, as seen in Hanzek, as an efficient way to offer the customers in Edgar an interface to schedule appointments of the services offered.

As per claim 54, Edgar discloses receiving an order regarding a purchase being requested by a user (i.e., request for an appointment by a customer), determining a selected day for which the order is to be delivered, the selected day having a day of week associated therewith (i.e., appointment offered within a predetermined time slot), and determining a delivery attribute to fulfill the order, with the attribute depending on both the selected day and the day of the week, and with the attribute not pertaining to time or day (i.e., use of routes stored in database to offer a number of possible appointments to customers), wherein an electronic system thereafter schedules at least one delivery stop based on the delivery attribute for fulfilling the

order (scheduler 13). Edgar does not disclose an online store to enable a user to purchase goods or services over a computer network. Hanzek discloses a web-based system 310, including a consumer front end 339, used for product ordering, tracking, and delivery of consumer products (figure 3). Both Edgar and Hanzek are concerned with effective delivery of products to consumers. Scheduling service visits, as seen in Edgar, and scheduling delivery of a product, as seen in Hanzek, are both ultimately concerned with the optimization of a route, via an algorithm, in order to facilitate product and service delivery to the consumer in the most expeditious manner. As a result, it would have been obvious to one having ordinary skill in the art at the time the invention was made to include the electronic storefront in Edgar, as seen in Hanzek, as an efficient way to offer the customers in Edgar an interface to schedule appointments of the services offered.

### ***Response to Arguments***

8. In the Remarks, with respect to the rejection of claim 53 under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement, Applicant argues that one skilled in the art would understand that route types are descriptors or identifiers for grouping the different routes and therefore are not the same as geographic regions. The Examiner respectfully disagrees and reasserts that there appears to be no language in the specification indicating that the route types are independent of geographic location. Moreover, Applicant's specification indicates that the routes typically represent a geographic area (at least page 2, lines

Art Unit: 3623

27-28 and page 6, lines 4-5), that the routes are organized according to geographic data (at least page 8, lines 15-17), and that each timeslot of a route is associated with geographical data (at least page 12, lines 20-21). As such, based on Applicant's specification, one skilled in the art would *not* understand nor conclude that the route types are necessarily independent of geographic location, as Applicant has claimed.

With respect to claims 1 and 17, Applicant argues that Edgar et al does not appear to provide any teaching for different route types or route types that are available as determined by a template, while adding that the tables 30 are merely daily schedules of routes for use by an operative. The Examiner respectfully disagrees and submits that in Edgar et al, the route types are defined by geographic region (i.e., A, B, C, etc.), wherein the region includes a number of routes associated therein (column 1, lines 59-60 and figure 2). As such, tables 30 (i.e., template) are indeed defined by route type, which may not include the particular routes, as seen in figure 3, wherein the tables are merely divided by region. Moreover, as seen in figure 3 (i.e., the fourth route from the left) region "B" indeed defines an entire route, therefore, contrary to Applicant's assertion, the regions may set the route, thus defining the route type.

Applicant also argues that Edgar et al does not teach "each of the routes is not separated into different route types," and that even if the route types did somehow correspond to the regions in Edgar et al, which Applicant's assert they do not, the routes in Edgar et al set the regions, which is distinctly different from the regions

setting the routes. The Examiner respectfully disagrees. First, as discussed above, in figure 3 (i.e., the fourth route from the left) region "B" indeed defines an entire route, therefore, contrary to Applicant's assertion, the regions may set the route, thus defining the route type. Moreover, the area in which appointments are to be booked is divided into regions *first* (column 1, lines 59-61 and figure 2), so the routes in Edgar et al *do not* set the regions, as asserted by Applicant.

Applicant also argues that the Examiner has not considered that the routes are determined based on the route types that are deemed available on a given day. The Examiner respectfully disagrees and submits that Edgar et al disclose areas in which appointments are booked is divided by region, thereby determining route type based upon region (column 1, lines 59-60), wherein tables 30 include routes for a day in a predetermined window (column 1, lines 64-66), thus indeed disclosing the routes being determined based on the route types that are deemed available on a given day.

Applicant also argues that Edgar et al lacks any notion of dynamically creating a schedule of timeslot segments, since the table 30 of routes cannot be a deemed a template. In addition, Applicant argues that the regions cannot be route types because regions are not descriptors or identifiers for the different routes. The Examiner respectfully disagrees. First, tables 30 define routes in a predetermined window in which appointments may be offered (column 1, lines 64-66), thus indeed identifying a template of appointment timeslot segments. Moreover, as discussed above, in figure 3 (i.e., the fourth route from the left) region "B" indeed defines an

entire route, therefore, contrary to Applicant's assertion, the regions may set the route, thus defining the route type.

Applicant also argues that Hanzek does not teach or suggest scheduling delivery stops using a set of schedulable timeslot segments. As seen in the above rejection, Hanzek is being relied upon to disclose an electronic storefront system, not to teach or suggest scheduling delivery stops using a set of schedulable timeslot segments. Further, Hanzek discloses a web-based system 310, including a consumer front end 339, used for product ordering, tracking, and *delivery* of consumer products (figure 3).

With respect to claims 1 and 54, in response to Applicant's argument that there is no suggestion to combine the references, the Examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and *In re Jones*, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, both Edgar and Hanzek are concerned with effective delivery of products to consumers. Scheduling service visits, as seen in Edgar, and scheduling delivery of a product, as seen in Hanzek, are both ultimately concerned with the optimization of a route, via an algorithm, in order to facilitate product and service delivery to the consumer in the most expeditious manner. Moreover, it must be recognized that any judgment on obviousness is in a sense necessarily a

reconstruction based upon hindsight reasoning. But so long as it takes into account only knowledge which was within the level of ordinary skill at the time the claimed invention was made, and does not include knowledge gleaned only from the applicant's disclosure, such a reconstruction is proper. See *In re McLaughlin*, 443 F.2d 1392, 170 USPQ 209 (CCPA 1971).

With respect to claims 24 and 45, Applicant argues that neither Edgar et al nor Hanzek disclose templates as recited in the claims. The Examiner respectfully disagrees and submits, as discussed above, tables 30 define routes in a predetermined window in which appointments may be offered (column 1, lines 64-66), thus indeed identifying a template of appointment timeslot segments.

With respect to claim 53, Applicant argues that neither Edgar et al nor Hanzek disclose determining available routes in the manner recited in the claim, particularly when the route types are independent of geographical location. First, the Examiner notes that, as discussed above with respect to the rejection of claim 53 under 35 U.S.C. 112, first paragraph, the Examiner has not found any language where the route types are independent of geographic location. Contrarily, Applicant's specification indicates that the routes typically represent a geographic area (at least page 2, lines 27-28 and page 6, lines 4-5), that the routes are organized according to geographic data (at least page 8, lines 15-17), and that each timeslot of a route is associated with geographical data (at least page 12, lines 20-21). Moreover, as seen in figure 3, Edgar et al defines the route type by both region (i.e., fourth route from the left) and by itinerary for an operative (e.g., first route from the left), thus

Art Unit: 3623

indeed determining available routes in the manner recited in the claim, particularly when the route types are independent of geographical location.

### ***Conclusion***

9. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

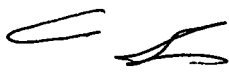

10. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Andre Boyce whose telephone number is (571) 272-6726. The examiner can normally be reached on 9:30-6pm M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tariq Hafiz can be reached on (571) 272-6729. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Art Unit: 3623

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
